/note="Vector: pBRCDNASfiAB; The library was constructed from 10 different sources of RNA from a single genotype. Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_IB=QE_EFGHJ lettuce serricla

XhoI; The cDNA library was constructed from mRNA isolated
from very young seeds (less than 20mgs). The library was
prepared using the Stratagene pBluescript II SK (+)
library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with an Xho I restriction site. Eco RI
adaptors were ligated to the blunt-ended cDNA fragments
followed by Xho I digestion. The cDNA insert is protected
from Xho I digestion via methylation during first strand
cDNA sythesis. The cDNA fragments were directionally
cloned into the Eco RI-Xho Irestriction site of the
pBluescript vector. The ligated cDNA fragments were
pBluescript vector. The ligated cDNA fragments were
library was constructed by Anu Khanna (Lila Vodkin lab,
University of Illinois)."

//note="Organ: -P proteoid root (cluster root); Vector:
pBLUESCRIPT SK(+/-); Site 1: EcoRI; Site 2: XhoI; Proteoid
roots of white lupin grown under P deficient conditions
were harvested 12 and 14 DAE (days after emergence), and
poly(A)+ RNA was isolated. The poly(A)+ RNA obtained from
plants 12 and 14 DAE was combined in a 1:1 ratio and 7 ug
total RNA was used for reconstruction of a proteoid root
cDNA library in the phage ZAPII vector according to the
manufacturer's instructions (Stratagene, La Jolla, CA, USA
). For conversion of the phage library into the plasmid
form, mass excision was performed according to the
procedure described by Stratagene."

587 bp mRNA linear EST 30-DEC-1997
psis thaliana cDNA clone 193M15T7, mRNA

Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; rosids; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

1 (bases 1 to 587) McIntosh

Genes galore: a summary of methods for accessing results from large-scale partial sequencing of anonymous Arabidopsis cDNA clones Plant Physiol. 106, 1241-1255 (1994)

/note-Tvector: lambda Zip-Lox; Site 1: Sal; Site 2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and 7

Genes with similarity to proteins in the databases are described in
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://compbio.ornl.gov/Grail.1.3)),
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremlinl.zool.iastate.edu/cgi-bin/sp.cgi).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       253

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Structural analysis of Arabidopsis thaliana chromosome 5. Sequence features of the regions of 3,076,755 bp covered
                                                                                                                                                         shorter because we remove overlaps between neighboring The 5' clone is MDN11 and the 3' clone is K23F3.
                                                                                                                                                                                       This sequence may not be the entire insert of this clone. It may be shorter because we remove overlaps between neighboring submissions.
                                                                                                                                                                                                                                    Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, http://genome.wustl.edu/eddy/tRNAscan-SE/)
